Search Demand Map

Amal Al Raisi

Mapping how users consume business-relevant content based on active search patterns, rather than internal seasonal codes.

Market focus

Oman as the home market. Saudi Arabia as the growth priority. UAE and wider GCC as regional validation. Global English demand as the international benchmark.

Summary | June 2026

1. Context and objective

The goal of this document is to identify the search patterns that will dictate the new website structure. The demand context is strictly in English, focusing on global localization with a heavy priority on Saudi Arabia (KSA) as the primary growth market.

2. Research basis and limits

This Search Demand Map is based on the products currently offered and the specific features of the site. We mapped this inventory against what people are actually searching for online to determine the most viable page types.

3. The core structural finding

The old structure was organised around seasons and internal look names. Examples include SS25, AW24, Spring/Summer and product names such as Look 1 or Look 31. This creates a mismatch between how the catalogue is organised and how customers search.

- Search starts from product and occasion terms, not season codes. Customers search for kaftan dress, evening dress, maxi dress, Eid outfit or wedding guest outfit.
- Authority needs stable pages. Evergreen category URLs can build visibility over time. Seasonal pages should not replace the main shopping categories every year.
- Product meaning should be visible. A look name can remain editorial, but it needs a descriptive product type attached to it.
- Internal linking should reinforce permanent pages. Product categories, occasion pages and guides should connect to the same stable commercial pages.

Decision

Build the site around evergreen product categories and a parallel occasion layer. Keep seasons as tags, campaign pages or editorial collections, not as the primary SEO architecture.

4. Demand summary

The table below outlines the main recurring search trends related to the brand.

*All search volumes are average monthly figures pulled from Ahrefs. (Ahrefs= specialized data analysis tool used to measure search behavior and visibility on Google.)

Demand cluster	KSA	UAE	Oman	Global	Difficulty
Kaftans	800	2,100	150	164,000	Very low
Evening and occasion dresses	300	700	20	31,000	Very low
Maxi and long dresses	1,300	1,800	150	253,000	Very low
Jumpsuits	150	2,000	150	332,000	Very low
Sets and co-ords	150	500	40	57,000	Very low
Wedding guest	200	600	10	165,000	Low
Eid and Ramadan	200	250	Near zero in English	6,500	Very low
Abayas	5,200	11,000	800	330,000	High
Jalabiya	800	1,700	60	12,000	Very low
Modest dresses	200	600	60	30,000	Very low

How to read this

- Kaftans, evening dresses, maxi dresses, jumpsuits and sets are the clearest launch categories. They combine demand, low difficulty and product support.
- Dresses should not become one flat SEO page. Demand splits into evening or occasion intent and maxi or long dress intent. Both should be reflected in the structure.
- Abaya is the largest term in the home-market English set, but it is not a launch backbone category. It has high regional difficulty and limited product depth in the current range.

5. Required Page Templates to Support Search Demand

To support the search demand patterns outlined in this document and maintain an organized site architecture, several distinct template types are required.

(Note: The category names and navigation hierarchy will be provided in the upcoming Website Structure document. This list simply defines the structural templates needed).

1. E-Commerce & Product Templates

Shop Template (Parent): The shop page that displays primary categories & products

└─ **Primary Category(Child of Shop):** The standard shoppable product grid for the main evergreen product families (e.g., Evening Dresses, Sets).

└─ **Subcategory & Attribute Template (Child of Primary Category):** Dedicated SEO landing pages functioning as product grids for highly searched details (e.g., Silk Scarves, Embroidered Dresses).

2. Occasion & Event Templates

Occasions Hub Template (Parent): A visual routing menu that links out to all the different specific event pages.

└─ **Specific Occasion Template (Child):** The destination product grid for specific search-driven events (e.g., Wedding Guest, Eid), populated by tags.

3. Brand & Campaign Templates

Collections Hub Template (Parent): A visual routing menu that links out to the brand's different seasonal lookbooks.

└─ **Brand & Editorial Template (Child):** The destination page housing internal seasonal codes and named campaign lookbooks (e.g., Spring/Summer 26).

4. Blog & Editorial Content Templates

To support the monthly SEO content program, the blog architecture requires its own specific structure:

Blog Grid Template (Parent): The main landing page displaying a visual feed of all recent articles.

└─ **Blog Category Template (Child):** A routing page to group articles by specific topics (e.g., Styling Guides, Cultural Heritage) so users can easily filter content.

└─ **Blog Article Template (Child):** The layout for the individual long-form articles, which must include the ability to link directly to commercial products.

6. What stays as brand, season or story

Not every collection should be search-led. Some pages exist for brand storytelling, campaign presentation or merchandising.

- Named collections such as Echoes of Time and Summer Voyage should stay as brand or editorial collections and product tags. They should not replace the main SEO categories.
- Season codes such as SS25 or AW24 should remain internal organisation, tags or campaign pages. They should not be the shopping backbone.
- Editorial content should support the monthly SEO programme. It can cover styling, Omani heritage, kaftans, Eid, wedding guest dressing and modest fashion, then link into the commercial pages.

7. Competitive context

Search results contain different types of sites and they should not all be treated as direct competitors.

- Direct competitors are specialized modestwear, kaftan, or regional fashion brands.
- Marketplaces and department stores (like Ounass and Bloomingdale's) are important benchmarks, but not brands to copy directly.
- Generalist and discount retailers win broad terms through price and scale. Amal Al Raisi will compete through specificity, premium positioning, and strong category relevance.
- Blogs, Pinterest pages, or dictionary definitions in the Google search results do not shape our category architecture.

8. What this means for Website Structure

This document does not replace the Website Structure deliverable. It defines the demand logic behind it.

Structure decisions to carry forward

- **Navigation:** Main navigation should prioritise product categories and occasions, not only seasonal collections.
- **URL Stability:** Category URLs should stay stable over time. Examples: /collections/kaftans, /collections/evening-dresses, /collections/maxi-dresses and /collections/sets. Eid, Ramadan and resort pages should be permanent recurring pages. They should be refreshed with new stock, not deleted and rebuilt every season.

9. Next steps

The web developer needs to confirm:

1. **Template Implementation:** Can the distinct structural templates outlined in Section 5 be fully implemented within the current website?

Once confirmed, we will:

- Start on the Website Structure document detailing the sitemap, navigation, and page hierarchy.
- Map the specific launch products into the agreed-upon categories and occasions.
